

# **Computer Programming & Problem Solving**

**CS100**

**Mrs Sanga G. Chaki**

**Department of Computer Science and Engineering  
National Institute of Technology, Goa**

**May, 2023**

# Contents

- 1. Unary Operator: sizeof()**
- 2. ceil() and floor() functions**
- 3. Searching**
  - a) Linear search**
  - b) Binary**
- 4. Sorting**
  - a) Bubble sort**

# sizeof

1. Unary operator which can be used to compute the size of its operand.

```
1  #include <stdio.h>
2  int main() {
3      int i;
4      int a[] = {1,2,3,4};
5      float f;
6      char c;
7      printf("The sizes of different datatypes in this machine:\n");
8      printf("The size of int = %d\n", sizeof(int));
9      printf("also the size of int = %d\n", sizeof(i));
10     printf("The size of float = %d\n", sizeof(f));
11     printf("The size of char = %d\n", sizeof(c));
12     printf("The size of array a = %d\n", sizeof(a));
13     return 0;
14 }
```

# sizeof

## Output

```
/tmp/rLgJi0f54k.o
```

```
The sizes of different datatypes in this machine:
```

```
The size of int = 4
```

```
also the size of int = 4
```

```
The size of float = 4
```

```
The size of char = 1
```

```
The size of array a = 16
```

**1. Try this in your machine**

# **ceil() and floor()**

- 1. Standard library functions to roundoff float values to integers**
- 2. The ceil function in C returns the nearest integer greater than the provided argument – argument is a float.**
- 3. floor() function returns the nearest integer smaller than the argument**

# ceil() and floor()

```
1  #include <stdio.h>
2  #include <math.h>
3
4  int main(){
5      double num = 8.33;
6      int r1, r2;
7      r1 = ceil(num);
8      printf("Ceiling integer of %.2f = %d", num, r1);
9      r2 = floor(num);
10     printf("\nFloor integer of %.2f = %d", num, r2);
11     return 0;
12 }
```

## Output

```
/tmp/gGn0GYZUCQ.o
Ceiling integer of 8.33 = 9
Floor integer of 8.33 = 8
```

# SEARCHING and SORTING

# Searching

**1. Check if a given element occurs in the array.**

**2. Two ways:**

- a) If the array elements are unsorted - Linear search**
- b) If the array elements are sorted - Binary search**

# Linear Search

## 1. Basic idea:

- a) Start at the beginning of the array.
- b) Inspect elements one by one to see if it matches the key (the element being searched).

# Linear Search - Example

Searched Element

39

# Linear Search - Example

```
1  #include <stdio.h>
2
3+ int main(){
4      int arr[] = {2, 3, 4, 5, 7, 1, 10};
5      int x = 4;
6      int N = sizeof(arr) / sizeof(arr[0]);
7      int i;
8      int flag = 0;
9+     for (i = 0; i < N; i++){
10+         if (arr[i] == x){
11             printf("\nElement is present at index %d", i);
12             flag += 1;
13         //         break;
14         }
15         else
16             continue;
17     }
18     if(!flag)
19         printf("Element is not present in array");
20     return 0;
21 }
```

# 3 new terms of Algorithmic Performance

**1. If there are  $n$  elements in the array:**

- a) Best case: match found in first element (1 search operation)**
- b) Worst case: no match found, or match found in the last element ( $n$  search operations)**
- c) Average case:  $(n + 1) / 2$  search operations**

# Binary Search

- 1. Basic idea: Binary search works if the array is sorted.**
  - a) Look for the target in the middle.**
  - b) If you don't find it, you can ignore half of the array, and repeat the process with the other half.**
- 2. In every step, we reduce the number of elements to search in by half.**

# Binary Search

1. Strategy: Find split between values larger and smaller than key
2. Situation while searching: Initially L and R contains the indices of first and last elements.
3. Then, look at the element at index  $[(L+R)/2]$ .
4. Move L or R to the middle depending on the outcome of test.

# Binary Search - Example

## Binary Search

Search 23	0	1	2	3	4	5	6	7	8	9
	2	5	8	12	16	23	38	56	72	91
23 > 16 take 2 <sup>nd</sup> half	L=0	1	2	3	M=4	5	6	7	8	H=9
	2	5	8	12	16	23	38	56	72	91
23 < 56 take 1 <sup>st</sup> half	0	1	2	3	4	L=5	6	M=7	8	H=9
	2	5	8	12	16	23	38	56	72	91
Found 23, Return 5	0	1	2	3	4	L=5, M=5	H=6	7	8	9
	2	5	8	12	16	23	38	56	72	91

# Binary Search - Example

```
1 // Binary Search in C
2 #include <stdio.h>
3 int main(void) {
4     int array[] = {3, 4, 5, 6, 7, 8, 9};
5     int n = sizeof(array) / sizeof(array[0]);
6     int x = 8; //to be searched
7     int mid, high, low, res = -1;
8     low = 0;
9     high = n-1;
10    // Repeat until the pointers low and high meet each other
11    while (low <= high) {
12        mid = low + (high - low) / 2;
13        if (array[mid] == x)
14            res = mid;
15        if (array[mid] < x)
16            low = mid + 1;
17        else
18            high = mid - 1;
19    }
20    if (res == -1)
21        printf("Not found");
22    else
23        printf("Element is found at index %d", res);
24    return 0;
25 }
```

# Why use Binary Search?

1. Suppose that the array  $x$  has 1000 elements.
2. In Linear search – If key is a member of  $x$ , it would require 500 comparisons on the average.
3. In Binary search
  - a) after 1st compare, left with 500 elements.
  - b) after 2nd compare, left with 250 elements.
  - c) after at most 10 steps, you are done.
  - d) If there are  $n$  elements in the array, number of searches required in the worst case:  $\log_2 n$

# Sorting

## 1. Basic Problem: Given an array

$x[0], x[1], \dots, x[\text{size}-1]$

reorder entries so that

$x[0] \leq x[1] \leq \dots \leq x[\text{size}-1]$

So that, the array is in non-decreasing or non-increasing order.

2. Example: If original list: 10, 30, 20, 80, 70, 10, 60, 40, 70

a) Sorted in non-decreasing order: 10, 10, 20, 30, 40, 60, 70, 70, 80

b) Sorted in non-increasing order: 80, 70, 70, 60, 40, 30, 20, 10, 10

# Bubble Sort

- 1. The sorting process proceeds in several passes.**
- 2. In every pass, we go on comparing neighboring pairs, and swap them if out of order.**
- 3. If we are sorting in ascending order, in every pass, the largest of the elements under consideration will bubble to the top (i.e., the right).**
- 4. Number of comparisons:  $n(n-1)/2$ , if there are  $n$  elements in the array.**

# Bubble Sort – Worked out example

PASS 1:

10	5	17	11	-3	12
5	10	17	11	-3	12
5	10	17	11	-3	12
5	10	11	17	-3	12
5	10	11	-3	17	12
5	10	11	-3	12	<u>17</u>

PASS 2:

5	10	11	-3	12	<u>17</u>
5	10	11	-3	12	<u>17</u>
5	10	11	-3	12	<u>17</u>
5	10	-3	11	12	<u>17</u>
5	10	-3	11	<u>12</u>	<u>17</u>

# Bubble Sort – Worked out example

PASS 3:

5	10	-3	11	<u>12</u>	<u>17</u>
5	10	-3	11	<u>12</u>	<u>17</u>
5	-3	10	11	<u>12</u>	<u>17</u>
5	-3	10	<u>11</u>	<u>12</u>	<u>17</u>

PASS 4:

5	-3	10	<u>11</u>	<u>12</u>	<u>17</u>
-3	5	10	<u>11</u>	<u>12</u>	<u>17</u>
-3	5	<u>10</u>	<u>11</u>	<u>12</u>	<u>17</u>

PASS 5:

-3	5	<u>10</u>	<u>11</u>	<u>12</u>	<u>17</u>
-3	5	<u>10</u>	<u>11</u>	<u>12</u>	<u>17</u>

Sorted

Homework: Code

# Bubble Sort – Code

```
1  #include <stdio.h>
2  int main() { //Bubble sort
3      int array[] = {10, 5, 17, 11, -3, 12}; //array to be sorted
4      int size = 5, step, i, temp;
5      for(step= 0; step<size - 1; step++) { // loop to access each array element
6          for(i=0; i<size - step - 1; i++) { // loop to compare array elements
7              if(array[i] > array[i + 1]) { // compare two adjacent elements
8                  temp = array[i]; // swap if elements not in the intended order
9                  array[i] = array[i + 1];
10                 array[i + 1] = temp;
11             } //end if
12         } //end inner for loop
13     } //end outer for loop
14     printf("Sorted Array in Ascending Order:\n");
15     for (i = 0; i < size; i++)
16         printf("%d  ", array[i]);
17     return 0;
18 }
```

# Useful Library Functions

## 1. math.h

- a) Floor
- b) Ceil
- c) Log
- d) Mod
- e) Sqrt
- f) Pow

## 2. string.h

- a) Strlen
- b) Strcpy
- c) Strcat
- d) strcmp

## 1. stdlib.h

- a) rand
- b) exit
- c) Malloc
- d) free

## 2. stdio.h

- a) Printf
- b) Scanf
- c) Getc
- d) Putc
- e) Fopen
- f) Fclose
